## Softmax 函数

$$p_i = rac{e^{z_i}}{\sum_{k=1}^K e^{z_k}}$$

## 前向传播

直接计算  $e^{z_i}$  可能导致数值溢出,特别是当  $z_i$  特别大的时候。因此,一般 Softmax 使用如下的计算公式:

$$p_k = rac{e^{z_k-z_{max}}}{\sum_{j=1}^K e^{z_j-z_{max}}}$$

其中

$$z_{max} = \max_j z_j$$

## 反向传播公式推导

因为  $p_i$  的分母是对特征向量求和,因而  $\frac{\partial L}{\partial z_i}$  需要用到链式法则:

$$rac{\partial L}{\partial z_i} = \sum_{j=1}^K rac{\partial L}{\partial p_j} rac{\partial p_j}{\partial z_i}$$

设:

$$S = \sum_{j=1}^K e^{z_j - z_{max}}$$

先计算  $\frac{\partial p_j}{\partial z_i}$ 

$$rac{\partial p_j}{\partial z_i} = rac{rac{\partial e^{z_j-z_{max}}}{\partial z_i}S - e^{z_j-z_{max}}e^{z_i-z_{max}}}{S^2}$$

即:

$$rac{\partial p_j}{\partial z_i} = p_j \delta_{ij} - p_j p_i$$

则:

$$rac{\partial L}{\partial z_i} = \sum_{j=1}^K rac{\partial L}{\partial p_j} \left( p_j \delta_{ij} - p_j p_i 
ight)$$

$$rac{\partial L}{\partial z_i} = \sum_{j=1}^K rac{\partial L}{\partial p_j} p_j \delta_{ij} - p_i \sum_{j=1}^K rac{\partial L}{\partial p_j} p_j = rac{\partial L}{\partial p_i} p_i - p_i \sum_{j=1}^K rac{\partial L}{\partial p_j} p_j$$

最终的公式如下:

Arya - 在线 Markdown 编辑器
$$rac{\partial L}{\partial z_i} = p_i \left(rac{\partial L}{\partial p_i} - \sum_{j=1}^K rac{\partial L}{\partial p_j} p_j
ight)$$
